

Notes

Structure	Rest Intervals	Session Order	Lifting	In-Season Adjustments
This program follows a 2:1 mesocycle structure throughout, including two weeks of loading followed by one deload week. This applies to both the sprint and lifting sessions. Unless otherwise noted, all sprint work is performed at 95% or above maximum effort.	Sprint rest is based on distance: 1 minute per 10 meters. A 20m rep gets 2 minutes rest, a 40m rep gets 4 minutes, a 60m rep gets 6 minutes, and so on. This ensures full recovery between efforts and maintains output quality. For lifting compounds/plyos get 4 minutes and accessories get 2 minutes.	Sprint sessions are performed first, followed by lifting sessions later in the day. All intense workout days should be seperated by 48 hours (ie. monday then wednesday). Inbetween these days you can perform some of the additional workouts	Heavy Compounds and Olympic Lifts are performed first, followed by upper body compounds and then accesory exercises for hypertrophy and joint health. Olympic lifts follow a linear progression style and other lifts follow a double dynamic progression scheme. As the season progresses, lifts become more explosive and concentric focused.	The 2:1 mesocycle is a guide, not a rule. Once competition begins, adjust weekly volume based on how you feel and when meets fall. A tough meet weekend may require a lighter Monday regardless of where you are in the cycle. The 3rd high intensity day of the week is removed during the in-season to leave room for meets
Warm Up	Additional Workouts	Progression Scheme	Minimum Threshold Calculator	
Follow the sprint warmup before all sprint sessions and the lifting warmup before all lifting sessions.	Additional workouts can be done throughout the week as long as there no more than 5 training days done in a week. Additional workouts should not be too demanding (ie. upper body hypertrophy, tempo, mobility, yoga, etc). Ideally these sessions should still allow for 48 hours of recovery if possible, if not they should remain low fatigue/intensity	Double Dynamic progression means each weight is increased for an individual set when the top of the rep range is reached. Linear progression for this program will follow 65% to 75% to 85% of estimated 1 rep max, then the next cycle will follow a 5-15lb increase based on RPE	Once you hit a new PR on the track during a workout, put that new value as your PR and let the calculator tell you what your minimum threshold you need to hit. The minimum threshold will tell if you are pushing hard enough and whether or not you need to call the workout early. If you don't hit the threshold your first rep, the rep doesn't count, take appropriate rest and try again. If no matter what you can't hit the threshold or you fail to hit it after a couple of reps, call the workout early, you are too fatigued.	

Sprinting Standards						How fast workouts should be						Bodyweight
Goal	10m	30m	10m fly	60m	120m		10m	30m	10m fly	60m	120m
